

WHAT IS CLAIMED IS:

Sub ar 7
5 1. ~~An apparatus for matching a configuration~~
of a first station of a local area network to a
configuration of a second station of the local area
network, comprising:

detecting means for detecting the configuration
of the second station;

10 comparing means for comparing the detected
configuration of the second station to the
configuration of the first station;

configuration changing means for changing the
configuration of the first station when the
comparison yields a first result; and

15 waiting means for waiting for the configuration
of the second station to change when the comparison
yields a second result.
